INTRODUCTION

Introduction

The Northern Region Highway Traffic Data and Forecasting section within the Department of Transportation and Public Facilities compiles the region's Annual Traffic Volume Report. Engineers, planners, administrators, local governments, and the public use the information within this report for work that requires information related to urban planning, construction of new roads, forecasting traffic patterns, and determining possible economic development areas.

The Northern Region encompasses a geographic area of approximately 394,000 square miles (252 million acres) an area greater than California, Nevada, and Arizona combined. This area stretches from Barrow to Cantwell and Nome to Valdez and includes approximately 65% of Alaska's land area, 25% of the state's population and 60% of State maintained highways. Northern Region maintains and operates approximately 3,500 miles of roads of which 48% are paved, 52% are unpaved, and 70% are on the National Highway System.

Traffic volume data is collected throughout the entire year at approximately 33 permanent traffic recorder (PTR) sites. These PTR sites are used to expand seasonal volume pneumatic tube or hose counts, which are referred to as short term counts. Short term counts are placed throughout the region during the months of May, June, July, August and the first part of September if the weather permits.

Because summer traffic is generally much higher than other times of the year, the counts are adjusted for weekday and

seasonal variations by using one or more associated PTR's to obtain an estimated Annual Average Daily Traffic (AADT). The calculated AADT then represents the traffic on the specific traffic link on which the count was taken.

Traffic classification data is collected throughout the entire year at 15 automated vehicle classifiers (AVC) sites. These AVC sites classify vehicles by type, based on the axle arrangement, number of trailers and other vehicle characteristics. Classification counts are also collected using seasonal classification pneumatic-tubes (hose) counts that are placed throughout the region during the months of May, June, July, August and the first part of September if the weather permits.

Northern Region also has two Weigh-In-Motion (WIM) sites. These WIM sites classify all vehicles by the same criteria as the vehicle classification counts, but include the added dimension of axle weights for all commercial size vehicles. WIM data collected at these two sites is not included in this report, but can be obtained by contacting DOT&PF Headquarters Planning Section.

This report provides a summary of all permanent, coverage and classification data collected throughout the Northern Region from calendar years 2011 through 2013.

DEFINITIONS AND TERMS

Definitions and Terms

Annual Average Daily Traffic (AADT): The estimated number of vehicles traveling over a given road segment during one 24 hour day. In practice, AADT is usually obtained from a sample (coverage count) adjusted for seasonality.

Automatic Polling: A method of obtaining data from automatic counters by telephone from a central computer location with automatic dialing equipment. Automatic counters in the field must have microprocessor memory and telephone connection.

Automatic Vehicle Classifier (AVC): Traffic counting station which automatically counts and classifies vehicles passing over its detectors, providing a record of types of vehicles and volumes by specific time intervals.

Axle-Body Combination: A vehicle description based on the configuration of axles, leading and trailing units, and tractor body.

Axle Correction Factor: The proportion by which a volume count based on axles (e.g., from pneumatic tube detectors) is multiplied to obtain an estimate of the number of actual vehicles. The ratio is 1.0 or less, and is derived from vehicle class counts.

Collector: A road classification applicable to roads servicing a mixture of local access and through traffic, for which the volume, average speed, and trip length of vehicles using the road are usually lower than for principal or minor arterials, but higher than for local roads.

Functional Classification: The process by which streets and highways are grouped into classes, or systems, according to the character of service they are intended to provide.

Highway Performance Monitoring System (HPMS): The data reporting system developed by the Federal Highway Administration (FHWA) for standardized road inventory, physical condition, and traffic use monitoring by all states.

Interstate Highway: A highway within the principal arterial category that is also designated as part of the Federal Interstate Highway System.

Link: A section of a road for which traffic data is reported. Link termini are located so that the traffic volume is roughly constant on a link.

Link Volume: The average number of vehicles passing over a traffic link in a 24-hour period of time. This is equivalent to the Annual Average Daily Traffic.

Local Roads: Any road (regardless of ownership) that is not classified as any higher type of arterial or collector. Serve primarily to provide access to adjacent land, provide service to travel over relatively short distances as compared to collectors or other higher systems. Local roads will, of course, constitute the rural mileage not classified as part of the principal arterial, minor arterial, or collector systems.

Major Arterial: A road serving mostly through movements, but with shorter trip lengths and at lower speeds than principal arterials.

Major Collector Roads: Major Collectors provide service to any county seat not on an arterial route, to the larger towns not directly served by the higher systems, and to other traffic generators of equivalent intra-county importance, such as consolidated schools, shipping points, county parks, important mining and agricultural areas, etc. Major Collectors link these places with nearby larger towns or cities, or with routes of higher classification and serve the more important intra-county travel corridors.

Minor Collector Roads: Minor Collectors are spaced at intervals, consistent with population density, to collect traffic from local roads and bring all developed areas within a reasonable distance of a collector road, provide service to the remaining smaller communities, and link the locally important traffic generators with their rural hinterland.

Monthly Average Daily Traffic (MADT): The estimated average daily traffic volume for a specific month at a given location.

Permanent Count: Hourly, directional or non-direction total traffic volumes collected year-round with Permanent Traffic Recorders (PTR)'s at established locations. These counts are used to adjust coverage counts for seasonal variations to yield AADT's.

Permanent Detector: A vehicle detector that is permanently installed in a roadway, as compared to a portable detector. The most common permanent detector equipment employs an

inductive loop that senses a vehicle's presence as a change in the electrical characteristics of the loop. Piezo electric cables are used in conjunction with inductive loops to detect and sometimes weigh vehicle axles to determine a vehicle's type (classification) and sometimes weight.

Permanent Traffic Recorder (PTR): Traffic volume counting equipment that automatically counts vehicles passing over detectors, providing a record of those volumes by specific time intervals.

Pneumatic-Tube (Hose) Detector / Counter: A vehicle-detection device / counter consisting of a pneumatic rubber tube placed across a roadway, and which detects vehicles by sensing air pressure pulses from the vehicle axles passing over the tube.

Portable Counter: An automatic traffic counting machine which is moved from location to location where needed, rather than permanently installed in one location.

Principal Arterial: A Street or highway connecting major population centers with high traffic volumes, long average trip lengths, and very little local travel service.

Sampling Plan: A plan for collecting a sample from a larger population (e.g. traffic counting at a few locations to estimate traffic at all location).

Seasonally Adjusted Count: A traffic volume count that has been adjusted to an annual estimate from a raw count. The adjustment is based on the estimated relationship between volumes for the period counted and the annual average at one or more PTR's.

Short Term Count: An hourly (sometimes directional) total traffic volume collected for a three to seven day period on a cycle of one to three years. Counts are generally done with a portable automatic traffic counter using pneumatic-tubes (hoses) or inductive loops in the road. Locations of counts remain the same from one rotation year to the next.

Vehicle Classification Count: A volume count that classifies vehicles by type (trucks, trailers, buses, recreational vehicle,

automobiles, motorcycles, etc.) based on axle arrangement. Data may be collected manually or using specially designed automatic counters.

Vehicle Miles of Travel (VMT): For any given traffic link or combination of links, the sum of miles traveled by all vehicles; usually calculated as the sum of the products of each link length and annual average daily traffic (AADT) for that link.

$VMT = (\text{Link Length}) \times (\text{Link AADT})$

PART II

State Route Index for Northern Region

Road Listings by Route Description

Road Listing By Route Description

The road listing is a cross-reference guide to match common road names to the Coordinated Data System (CDS) route number. The CDS route number is a data base reference number. The CDS route number is primarily assigned to a single road but it may contain several roads or parts of roads. Conversely, a single road may be divided into multiple CDS routes. Each year route numbers may be added, changed or divided into separate routes. The mileage listed for the route or road named in the index may represent only a portion of that road's total length. Also, road lengths represent only the portion of road on which traffic data is collected.

The purpose of this section of the report is to serve as an index to the AADT listing in the Vehicle Miles Table section. The index is listed alphabetically by Route Description (common

road name); following across the page is the Route Name (actual CDS route number), the Mile Points (length of the road or length of the section of the road), and the termini description (written description of beginning of route to end of route).

To look up the AADT of a road you will need to find the route name, which is numerical. To get the number, look up the name of the street/road in question; follow across the page to get the route name/number. Once the 6-digit number is obtained go to the Vehicle Miles Table shown in the report. The Vehicle Miles Table is listed by route name/number in numerical ascending order. Locate the 6 digit route name/number and there will be the street in question with the accompanying AADT's for 2011, 2012, and 2013.

Fixed Recorder Index

Permanent Traffic Recorder Summaries

Permanent Traffic Recorder Summaries

This section contains summaries of each of the major permanent traffic recorders (PTR's). These recorders have been strategically placed throughout the region to provide accurate, year round, hourly traffic volume data. The recorders also provide historical traffic trends. The seasonal factors from the PTR's are used to calculate the AADT's for the coverage counts.

The PTR Index references the locations by the CDS route number and milepoint. The milepoint often does not correspond to milepost locations given on the road. The summaries show seasonal, day of the week, and hour of the day traffic statistics. Each day of the week and the time periods of 6AM to 10 PM and 10 PM to 6 AM are listed as an average percent of the Monthly Average Daily Traffic (MADT). Also

included are the highest days and highest hours of traffic with the associated percentage of the AADT. Most critical (in urban traffic) is the 30th highest hour called the design hourly volume (DHV). The DHV is used for determining the design and structure of new roads or to improve existing roads in urban areas. The historical data section of each summary lists all the AADT's on record for each station's specific location.

Traffic patterns change for many reasons; population changes, shifts in the center of industries, changes in retail businesses, and construction during summer peak months, which may cause drivers to choose other routes. Increases in both peak and winter traffic indicate changes in resident usage, while increases in peak summer traffic only more likely indicate increased tourism or summer workers.

Other information that may help in determining the direction of traffic:

Traffic Direction Codes:

North Bound =1
East Bound =3

South Bound = 5
West Bound = 7

North / South Bound = 9
East / West Bound = 0

PART IV

Vehicle Classification Summary

Vehicle Classification Data

Vehicle classification data is recorded by automatic vehicle classifiers (AVCs). Data collection sites are determined by either HPMS statistical sampling requirements or highway construction projects. Data is collected for at least a week during the summer with portable AVCs, and throughout the year at some Permanent Traffic Recorder sites equipped with an AVC.

The data is summarized to provide percentages of vehicles falling into categories determined by vehicle type and axle arrangement. The Federal Highway Administration (FHWA) Vehicle Classification standard is used to categorize the vehicles into 13 classifications. The percentages of Class 1's, 2's, and Class 3's may not be individually accurate due to limitations on the ability of the AVC equipment to distinguish between cars and pickup trucks based solely on axle spacing. The combined percentages of Class 1's, 2's and Class 3's do accurately represent the total of non-commercial vehicles. Classes 4 through 13 are considered commercial type vehicles. The volume of heavy commercial vehicles in the traffic stream is of vital importance for road structure and geometric design.

FHWA Classifications:

Single Unit

- Class 01: Motorcycles
- Class 02: Automobiles, Automobiles with trailers
- Class 03: Pick up Trucks, Pick up Trucks with Trailers
- Class 04: Buses (2 or 3 axles)
- Class 05: Delivery Trucks, Recreational Vehicles, Dump Trucks (2 axles, 6 Tires)
- Class 06: Dump Trucks, Recreational Vehicles (3 axles)
- Class 07: Concrete Trucks, Fuel or Propane Delivery Trucks (4 or more axles)

Single Trailer

- Class 08: Tractor/Truck with Trailer (2 axles, 6 tires)
- Class 09: Tractor/Truck with Trailer (3axles)
- Class 10: Tractor/Truck with Trailer (4 or more axles)

Multi- Trailer

- Class 11: Tractor/Truck with 2 Trailers (5 axles)
- Class 12: Tractor/Truck with 2 or more Trailers (6 axles)
- Class 13: Tractor/Truck with 2 or more Trailers (7 or more axles)

2011 - 2013

PART V

Vehicle Mile Tables

Annual Average Daily Traffic

The basis for determining traffic link Annual Average Daily Traffic (AADT) is determined by collecting raw data from coverage counts, then adjusting for seasonal variation. Links lacking raw data are estimated by using growth rates determined by analysis of Permanent Traffic Recorder (PTR) data, or comparisons to other counted links. This is done to assure that all vehicle mileage was updated and included, and therefore provides compatible data to compare with historical data for analysis.

The average daily traffic varies along stretches of roads or highways dependent upon breaks in traffic patterns. Businesses, shopping centers, recreation areas, crossroads, etc. change the flow and direction of traffic. Highways and roads are divided into sections by significant traffic breaks. These sections are called links. The AADT of a link multiplied by the length of the link results in the number of Vehicle Miles Traveled (VMT) for that section. VMT is used for economic comparisons, computing accident rates, analyzing road use and motor vehicle growth rates.

The AADT table contains data for many roads in the Northern Region. Traditionally, these were state owned or maintained roads, but starting in 1991, most roads designated higher than a local road in the functional class scheme were added to the traffic counting inventory regardless of their ownership.
